Monitor consumption on
all taps with IoT
flowmeters and **AI**

Reduce equipment breakdowns,
automate deliveries and
minimize wastage

flowplan

// Flowplan enables us to monitor consumption across all our customers. Orders are planned automatically based on data instead of guess-work. It's a win-win. //

Never run out

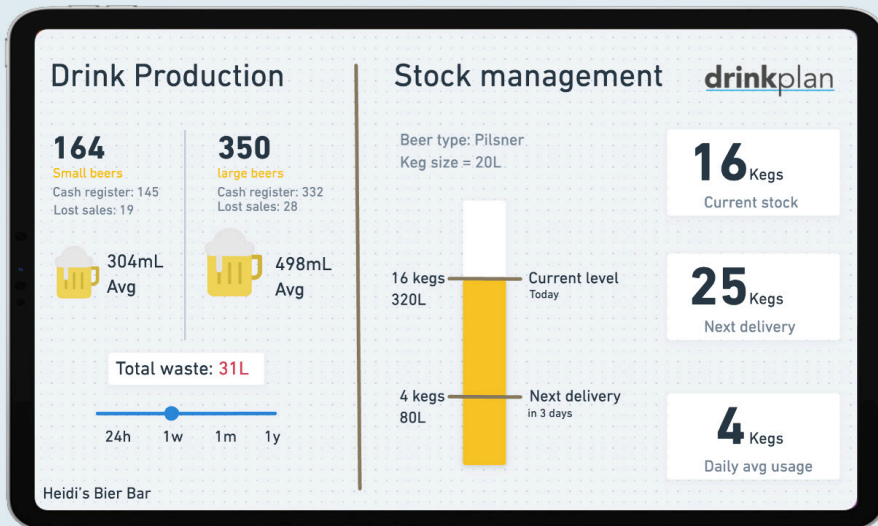

By monitoring the consumption, Flowplan ensures you always know stock levels of all customers, allowing you to deliver before it's too late.

Monitor equipment health

Flowplan monitors for both cleanings and temperature deviations and thereby allows the service team to take action before the equipment fails.

Reduce wastage

By monitoring the actual flow, Flowplan enables you to compare sales data with flow data and get insights to losses and wastage.

Plug-n-play installation

Our **Flowmeter (1)** is installed directly on the existing tap line, and connected to the Flowplan **Beam (2)**. That's it. The Beam automatically connects to the network and everything else is then handled by the system. All data is transmitted via the Beam's own cellular network, onto our **Backoffice** system where it's processed and analyzed. Flowplan automatically predicts consumption, stock levels, maintenance visits and even gives insights to beverages poured, shrinkage and much more! Flowplan works on all liquids flows and enables you to digitize all taps, no matter the type or age.

Improve logistics

Automate stock management

Monitor consumption
